

Germs Are Everywhere!

That's why we coat all our exposed wood at a molecular level with 24/7 antimicrobial finish.

ALL finished wood parts are coated in our antimicrobial finish as a **standard procedure** - even our casegoods.

Unlike metal and plastics, scratches can be quickly sanded out and recoated on site with our touch-up kit, if necessary.

Treated performance fabrics are available to complete the overall protection of your furniture.

We exceed industry standards by using a 4 mil top coat on all our products for extra protection.

Not all antimicrobial finishes are the same.

Surface treatments wear off over time. By infusing the protective particles into the coating materials at a molecular level, our finish protects your surfaces for the life of the furniture as long as the coating is present. Our custom engineered protective 4 mil coating thickness reduces the concerns of wear.

How Does the Treatment Work?

A big win - there is **NO NEED** for **HARSH CHEMICALS!** Surface disinfectants temporarily eliminate bacteria, only to be reintroduced the minute the surface is re-touched. Through interrupting the reproduction process of the microbe, our finish protects 24/7, helping your cleaning crew keep up with their daily disinfecting activities.
